## PREFACE

This study was conducted as part of a cooperative effort by personnel from the Environmental Engineering Division (EED), Operations Branch (OB)\* of the Program Manager for Rocky Mountain Arsenal (PMRMA) and the U.S. Army Engineer Waterways Experiment Station (WES). Funding for participation by WES was provided by the PMRMA via military interdepartmental purchase request (MIPR) number 0933. Project Management was provided by Messrs. David W. Strang, EED, and Norman R. Francingues, WES Environmental Laboratory (EL).

The contributing authors to this report were Douglas W. Thompson and Ms. Beth C. Fleming (WES-EL). The authors acknowledge the support and assistance of the following people and organizations during this study: Ms. Dianna R. Pantleo, and Messr. Bruce Fritz, D. P. Associates.

---

\* Formerly the Remedial Action Division (RAD), Remedial Operations Branch (ROB).

SOUTH PLANTS CERCLA PRETREATMENT SYSTEM  
OPERATIONAL ASSESSMENT  
FY91 ACTIVITIES

PART I: INTRODUCTION

Background

1. The South Plants CERCLA Pretreatment System Operational Assessment described herein has been prepared to document and evaluate the treatment process performance related to the system operations. This is the third annual report and covers the operating period between October 1990 and September 1991 (FY91).

Treatment System Description

2. The South Plants CERCLA Pretreatment System (CPS) was initially constructed in 1982 primarily as a means of treating waste from the analytical and bioassay laboratories at the Rocky Mountain Arsenal (RMA). Over the years, the CPS has been increasingly used for the treatment of other wastewaters generated on the arsenal from various field activities. The system was upgraded in 1988 to include an air stripper for the polishing removal of volatile organics. The system was modified during the period May 1990 through September 1990 at which time the existing 24-inch diameter activated carbon column and 8-inch diameter activated alumina column were removed and replaced with two 55-gallon contactors, one containing activated carbon and the other containing activated alumina. These modifications were made to facilitate easier replacement of spent adsorption media and reduce the plugging experienced with the two columns. The modifications were completed by RMA personnel and the CPS was placed back in operation during October 1990.

3. At the start of FY91, the CPS consisted of a steam-heated, 170,000 gallon, above-ground holding tank; a pump; a small in-line cartridge filter; a 55-gallon contactor containing activated carbon; a 55-gallon contactor containing activated alumina; a 30-gallon surge tank; a transfer pump; a 10,000-gallon holding tank; a feed pump; and, an air stripper (see Figure 1). The adsorption contactors limited the maximum flow to approximately 3 gallons per minute (gpm). The air stripper has a maximum design flow of approximately 10 gpm. The activated carbon served to remove organic contaminants while the activated alumina served to remove fluoride. The air stripper

# SOUTH PLANTS WASTEWATER TREATMENT SYSTEM FLOW DIAGRAM

Figure 1. System Layout

served as a polishing technique to remove additional volatile organics not effectively removed by the activated carbon.

4. In operation, the wastewater was fed from the 170,000-gallon holding tank through the in-line filter, through the activated carbon contactor, through the activated alumina contactor, and into the small surge tank. The wastewater was then pumped to the 10,000-gallon holding tank until it reached a high level controlled by a level sensor at which time the air stripper was started and operated until the holding tank was emptied. The treated water was discharged to the sanitary sewer. The system was operated during normal working hours by RMA personnel periodically during FY91.

5. During FY91, the CPS was used to treat wastewater generated from the RMA laboratory, decontamination pad operations, remedial investigation studies, comprehensive monitoring program, and interim response actions. The wastewater from the laboratory discharged into a sump located outside the northwest corner of the laboratory building. Other wastewaters were transported from their point of generation (i.e. the South Plants Decontamination Facility) by tanker trucks and discharged into the sump. From the sump, the wastewater was pumped by means of an underground pipeline to the 170,000-gallon holding tank located adjacent to the CPS building.

#### Report Objectives

6. Report objectives include:

- a. To assess the effectiveness of the South Plants in treating liquid wastes that were generated from the various activities at RMA.
- b. To document system operating parameters.

#### Approach

7. The approach to developing this study incorporates direction of the Environmental Engineering Division (EED) at RMA. EED established and provided the reporting framework and objectives, the database, and general technical guidance. The U.S. Army Engineer Waterways Experiment Station (WES), Vicksburg, Mississippi, provided specialized environmental engineering assessments.

## PART II: SYSTEM OPERATIONS

### System Operational Summary

8. As previously discussed, the CPS was modified during FY90 and was placed back in operation in October 1990. As in previous years, a record of FY91 system operations for the CPS was maintained by RMA plant operations personnel with major events documented on a daily basis. This daily record contains information on the operation, maintenance activities, and repairs of the treatment equipment. It also details other events such as plant downtime, equipment failure, and carbon and alumina replacement. The daily record indicates that the system operated and discharged treated water to the sanitary sewer system for three weeks in October 1990; nine weeks in January, February, and March 1991; and ten weeks in July, August, and September 1991. The system also operated in July and August in a recirculation mode with no discharge to the sanitary sewer as described below.

9. Cold weather in late October 1990 resulted in frozen piping and gauges at the treatment plant. The plant was shut down on November 3, 1990, for repairs. The repairs were completed and the plant was placed in operation on January 14, 1991. The treatment system operated until the middle of March 1991 when the influent feed pump needed repair work. While repairs of the feed pump were ongoing, a batch of wastewater from the South Plants Decontamination Facility was transferred to the CPS storage tank which was thought to contain a high fluoride concentration based on its source of generation. Onsite testing of the wastewater in the storage tank using a specific ion electrode method indicated fluoride concentrations approaching 50 mg/l. This level was later confirmed by laboratory testing under the normal sample collection and analysis program. A concentration of 39.0 mg/l was reported in an influent sample collected on August 6, 1991. Based on the higher than normal fluoride concentration in the influent storage tank, a management decision was made to modify the treatment system and to operate in a manner that permitted recirculation of effluent to assure sufficient fluoride removal prior to discharge.

10. The modifications were made between May 1991 and July 1991. In addition to allowing for recirculation, a 55-gallon drum containing limestone chips was placed on line ahead of the carbon adsorber. The concept was that the wastewater flowing in contact with the limestone would dissolve some of the limestone resulting in an increased calcium concentration effecting a reduction in fluoride due to precipitation of calcium fluoride. In late July 1991, the treatment system was placed back in

operation. Wastewater flowed through the limestone, activated carbon, activated alumina and into the 10,000-gallon holding tank. The fluoride concentration was then checked using the onsite fluoride detection method. If the fluoride concentration exceeded 2.0 mg/ℓ, the wastewater was recycled through the limestone, carbon, and aluminum treatment process. Once the 2.0 mg/ℓ criteria was met, the wastewater was then treated using the air stripper and discharged. No wastewater was discharged to the sanitary sewer from the CPS during all of July and most of August 1991. Wastewater was discharged to the sanitary sewer starting on August 30, 1991, when the effluent fluoride concentration had been reduced to below 2.0 mg/ℓ. During September 1991, the treatment system was operated normally and in the recycle mode when necessary to achieve the fluoride concentration criteria. By the end of September, most of the high fluoride wastewater had been treated and the fluoride concentration in the influent to the system was within normal values for single pass treatment. The treatment plant operation was converted back to a single pass mode and was successful in producing an effluent meeting the fluoride concentration criteria.

#### System Flow Quantities

11. The volume of water treated by the CPS was measured using a totalizing flow meter located on the effluent line from the carbon/alumina treatment subsystem. The meter was read and the values recorded on a daily basis while the system was operating. Weekly flow quantities were calculated from the daily reports. Flow rates were calculated by dividing the total flow for the week by 10,080 minutes per week. Flow quantities and calculated flow rates for the CPS for FY91 are presented in Appendix A.

12. A graph of weekly flow rates has been prepared and is presented in Figure 2. The maximum flow rate during FY91 was 2.06 gpm. The total volume of water treated and discharged in FY91 was 189,115 gallons which was somewhat less than the 240,249 gallons treated in FY90.

#### Carbon/Alumina Usage

13. The CPS plant operation records indicate that during FY91, 3600 pounds of activated carbon and 4240 pounds of activated alumina were used in the respective adsorption contactors. Based on the volume of water treated, the usage rates were

# South Plants FY91

Figure 2. System Flow Quantities

16.4 pounds of carbon and 19.3 pounds of alumina per thousand gallons of water treated.

#### System Water Quality

14. The quality of the water entering the treatment system, after carbon/alumina treatment, and leaving the system was monitored periodically by taking grab samples and analyzing them for a variety of analytes. These samples were collected from sampling ports located in the influent line, in the line between the carbon/alumina treatment subsystem and the air stripper holding tank, and in the effluent line from the air stripper. Sampling was conducted during the three periods of operation in FY91.

15. All water samples were collected in new glass containers (for organics analyses) or plastic containers (for metals analyses), sealed, and transported to the appropriate analytical laboratory at RMA or their contractor for analysis. In FY91, the samples were generally analyzed for the analytes listed in Table 1. The analytes are organized in four groups including chemical-specific applicable or relevant and appropriate requirements (ARAR) analytes, to be considered (TBC) analytes, other target analytes, and GC/MS scan. As indicated in the Final Decision Document for the CERCLA Wastewater Treatment System, Interim Response Action (IRA) at RMA, dated July 1990, the existing South Plants Wastewater Treatment Facility (SPWTF) was to continue to be operated prior to the implementation of the new system. The SPWTF would be subject to and comply with the chemical-specific ARAR's identified and would attain these limitations to the maximum extent practicable. The chemical-specific ARAR analytes each have concentration criteria which are applied to the effluent from the system. As a result, every attempt was made to operate the plant so as to maintain the concentrations of these analytes in the effluent below their respective criteria. The TBC analytes are compounds with concentration criteria which do not come within the definition of ARARS but were considered in the design of the new CERCLA system. The other target analytes are analytes for which promulgated standards were not found. GC/MS scans are conducted to identify any organic contaminants that are not included in the other analyte categories. FY91 was the first year in which the chemical-specific ARAR criteria were applicable to the CPS. As a result, the operation of the CPS was directed towards meeting these specific criteria. Although the other analytes do not have specific concentration criteria applicable to

B. TBC Analytes (Continued):

Dicyclopentadiene  
Diisopropylmethylphosphonate  
IMPA  
Methylene Chloride  
Methylisobutylketone  
Xylenes

C. Other Target Analytes:\*

Bicycloheptadiene  
p-Chlorophenylmethyl sulfur compounds  
Dithiane  
Dimethyldisulfide  
Fluoroacetic Acid  
Isodrin  
Malathion  
Oxathiane  
Thiodiglycol  
Supona  
Vapona

D. GC/MS Scan

---

\* Target analytes listed in the Final Decision Document for which promulgated standards were not found.

the operation of the system, they have generally been analyzed for use in monitoring the overall performance of the system.

16. All analyses of samples were performed using standard methods. The data were subjected to a quality control review, validated, and placed into the PMRMA database by D. P. Associates. Data sets were prepared from the database for use in developing the tables and figures used in this report. The analytical data, statistical summaries, and GC/MS data are presented in Appendix B. The statistical summaries were developed for each analyte and include the total number of samples analyzed, the certified reporting limit (CRL), the number of samples with concentrations above the CRL, the percent samples with concentrations above the CRL, the method numbers, the unit of measurement, the mean concentration, the low concentration, and the high concentration. A mean concentration was only computed for sets of data where 65 percent or more of the readings were above the CRL. When the criterion was met, values falling below the CRL were made equal to the CRL and included in the computations.

17. The analytical data were used to prepare graphs of the system influent, effluent from the carbon/alumina treatment subsystem, and system effluent concentrations reported for the chemical-specific ARAR analytes during FY91. These graphs are presented in Figures 3 through 34. The analytical results reported for the other analytes are discussed later in the report. Each graph (except where noted) presents a plot of the contaminant concentrations reported and two lines indicating the CRL and the average concentration over FY91 where sufficient data were available to calculate an average. Each system effluent graph has a third line indicating the ARAR standard for the analyte. The ARAR standards are summarized in Table 2 and the source of each standard is identified. All values in the table and on the graphs are reported in micrograms per liter ( $\mu\text{g}/\ell$ ) except where noted.

#### Chemical-Specific ARAR Analytes

18. Acrylonitrile. The ARAR standard for acrylonitrile at the CPS is  $2,600 \mu\text{g}/\ell$ . Acrylonitrile was not specifically analyzed for during FY91; however, it was quantified in the three GC/MS analyses conducted in FY91. As a result, no graph was prepared for acrylonitrile. The GC/MS results indicate that no concentrations above  $8.4 \mu\text{g}/\ell$  were reported in any of the samples subjected to GC/MS analysis in FY91. Thus, no concentrations of acrylonitrile above the ARAR standard were reported for any CPS effluent samples in FY91.

Table 2  
Chemical-Specific ARAR Analytes

Analyte	Standard	Source
Acrylonitrile	2,600 $\mu\text{g}/\ell$	CBSM*
Aldrin	0.1 $\mu\text{g}/\ell$	CBSG**

\* Colorado Basic Standards and Methodologies for Surface Water 3.1.0 (5CCR 1002-8).

\*\* Colorado Basic Standards for Groundwater.

† Maximum contaminant level (MCL) established under the National Primary Drinking Water Standards.

19. Aldrin. The ARAR standard for aldrin at the CPS is  $0.1 \mu\text{g}/\ell$ . As indicated in Figure 3, neither of the two influent samples analyzed for aldrin during FY91 were reported with concentrations in excess of the CRL. None of the fourteen carbon/alumina subsystem effluent samples were reported with concentrations in excess of the CRL. A single system effluent sample out of the sixteen collected was reported with an aldrin concentration above the ARAR standard. This sample was collected on October 10, 1990. The carbon/alumina effluent sample collected on this date was reported with an aldrin concentration below the CRL and the following weekly samples were below CRL (with no carbon change); therefore, the concentration reported above the ARAR standard for the system effluent sample is probably anomalous. None of the other fifteen system effluent samples collected during FY91 were reported with aldrin concentrations in excess of the CRL.

20. Arsenic. The ARAR standard for arsenic at the CPS is  $50 \mu\text{g}/\ell$ . The concentrations of arsenic reported for the three influent samples collected in FY91 ranged from  $3.4 \mu\text{g}/\ell$  to  $1300 \mu\text{g}/\ell$  with a mean value of  $494 \mu\text{g}/\ell$  as indicated in Figure 4. The concentrations reported for the three carbon/alumina effluent samples collected in FY91 ranged from  $10.8 \mu\text{g}/\ell$  to  $1400 \mu\text{g}/\ell$  with a mean value of  $474 \mu\text{g}/\ell$ . One of the three system effluent samples collected in FY91 exceeded the ARAR standard. A concentration of  $1700 \mu\text{g}/\ell$  was reported for the sample collected on August 7, 1991. The other CPS samples collected on this date were also reported as having arsenic concentrations in this range. The other two system effluent samples analyzed for arsenic in FY91 were reported with concentrations of  $12.5 \mu\text{g}/\ell$  and  $8.3 \mu\text{g}/\ell$  with an average for the year of  $574 \mu\text{g}/\ell$ . It should be noted that the CPS has no specific process for the removal of arsenic.

21. Benzene. The ARAR standard for benzene at the CPS is  $5 \mu\text{g}/\ell$ . As indicated in Figure 5, no concentrations of benzene above the CRL were reported for any of the three system influent, carbon/alumina effluent, or system effluent samples analyzed for benzene in FY91. Thus, no concentrations of benzene above the ARAR standard were reported for any system effluent samples in FY91.

22. Cadmium. The ARAR standard for cadmium at the CPS is  $10 \mu\text{g}/\ell$ . As indicated in Figure 6, no concentrations of cadmium above the CRL were reported for any of the three system influent, carbon/alumina effluent, or system effluent samples analyzed for cadmium in FY91. Thus, no concentrations of cadmium above the ARAR standard were reported for any system effluent samples in FY91. It should be noted that the CPS has no specific process for the removal of cadmium.

23. Carbon Tetrachloride. The ARAR standard for carbon tetrachloride at the CPS is  $5.0 \mu\text{g}/\ell$ . As indicated in Figure 7, no concentrations of carbon tetrachloride above the CRL were reported for any of the three system influent, carbon/alumina effluent, or system effluent samples analyzed for carbon tetrachloride in FY91. Thus, no concentrations of carbon tetrachloride above the ARAR standard were reported for any system effluent samples in FY91.

24. Chlordane. The ARAR standard for chlordane at the CPS is  $0.1 \mu\text{g}/\ell$ . As indicated in Figure 8, no concentrations of chlordane above the CRL were reported for any of the two system influent, carbon/alumina effluent, or system effluent samples analyzed for chlordane in FY91. Thus, no concentrations of chlordane above the ARAR standard were reported for any system effluent samples in FY91.

25. Chloride. The ARAR standard for chloride at the CPS is  $250 \text{ mg}/\ell$ . The concentrations of chloride reported for the three influent samples collected in FY91 ranged from  $57 \text{ mg}/\ell$  to  $180 \text{ mg}/\ell$  with a mean value of  $126 \text{ mg}/\ell$  as indicated in Figure 9. The concentrations reported for the three carbon/alumina effluent samples ranged from  $57 \text{ mg}/\ell$  to  $180 \text{ mg}/\ell$  with a mean value of  $126 \text{ mg}/\ell$ . None of the three system effluent samples collected in FY91 were reported with concentrations in excess of the ARAR standard. The concentrations reported ranged from  $68 \text{ mg}/\ell$  to  $240 \text{ mg}/\ell$  with a mean value of  $149 \text{ mg}/\ell$ . It should be noted that the CPS has no specific process for the removal of chloride.

26. Chlorobenzene. The ARAR standard for chlorobenzene at the CPS is  $300 - \mu\text{g}/\ell$ . As indicated in Figure 10, no concentrations of chlorobenzene above the CRL were reported for any of the three system influent, carbon/alumina effluent, or system effluent samples analyzed for chlorobenzene in FY91. Thus, no concentrations of chlorobenzene above the ARAR standard were reported for any system effluent samples in FY91.

27. Chloroform. The ARAR standard for chloroform at the CPS is  $100 \mu\text{g}/\ell$ . As indicated in Figure 11, the concentrations of chloroform reported for the three influent samples collected in FY91 ranged from  $9.3 \mu\text{g}/\ell$  to  $24.9 \mu\text{g}/\ell$  with a mean value of  $16.2 \mu\text{g}/\ell$ . Two of the fourteen carbon/alumina effluent samples were reported with concentrations in excess of the CRL ranging from  $6.4 \mu\text{g}/\ell$  to  $34.5 \mu\text{g}/\ell$ . None of the sixteen system effluent samples were reported with chloroform concentrations in excess of the ARAR standard. One of the system effluent concentrations was reported as being greater than the CRL.

28. Chromium. The ARAR standard for chromium at the CPS is  $50.0 \mu\text{g}/\ell$ . As indicated in Figure 12, no concentrations of chromium above the CRL were reported for any of the three system influent, carbon/alumina effluent, or system effluent samples analyzed for chromium in FY91. Thus, no concentrations of chromium above the ARAR standard were reported for any system effluent samples in FY91. It should be noted that the CPS has no specific process for the removal of chromium.

29. Copper. The ARAR standard for copper at the CPS is  $200 \mu\text{g}/\ell$ . The concentrations of copper above the CRL reported for two out of the three influent samples collected in FY91 were  $37.4 \mu\text{g}/\ell$  and  $51.8 \mu\text{g}/\ell$  with a mean value of  $36 \mu\text{g}/\ell$  as indicated in Figure 13. No concentrations of copper above the CRL were reported for any of the three carbon/alumina effluent samples analyzed for copper in FY91. None of the three system effluent samples collected in FY91 were reported with concentrations in excess of the ARAR standard. Two of the three samples were reported with concentrations in excess of the CRL at  $102 \mu\text{g}/\ell$  and  $197 \mu\text{g}/\ell$ . The mean value for FY91 for the system effluent samples was  $106 \mu\text{g}/\ell$ . It should be noted that the CPS has no specific process for the removal of copper.

30. p,p'-DDE. The ARAR standard for p,p'-DDE at the CPS is  $0.1 \mu\text{g}/\ell$ . As indicated in Figure 14, only one of the two system influent samples analyzed for p,p'-DDE in FY91 was reported with a concentration in excess of the CRL at  $0.37 \mu\text{g}/\ell$ . No concentrations of p,p'-DDE above the CRL were reported for any of the three carbon/alumina effluent or system effluent samples analyzed for p,p'-DDE in FY91. Thus, no concentrations of p,p'-DDE above the ARAR standard were reported for any system effluent samples in FY91.

31. p,p'-DDT. The ARAR standard for p,p'-DDT at the CPS is  $0.1 \mu\text{g}/\ell$ . As indicated in Figure 15, only one system influent sample was analyzed for p,p'-DDT in FY91. The concentration was reported to be below the CRL. No concentrations of p,p'-DDT above the CRL were reported for any of the two carbon/alumina effluent or system effluent samples analyzed for p,p'-DDT in FY91. Thus, no concentrations of p,p'-DDT above the ARAR standard were reported for any system effluent samples in FY91.

32. 1,4-Dichlorobenzene. The ARAR standard for 1,4-dichlorobenzene at the CPS is  $75 \mu\text{g}/\ell$ . As indicated in Figure 16, only one of the three system influent samples analyzed for 1,4-dichlorobenzene in FY91 was reported with a concentration in excess of the CRL at  $1.25 \mu\text{g}/\ell$ . No concentrations of 1,4-dichlorobenzene above the CRL were reported for any of the three carbon/alumina effluent samples. No concentrations of 1,4-dichlorobenzene above the ARAR standard were reported for any

system effluent samples in FY91. Only one of the three samples was reported with a concentration in excess of the CRL at  $39.1 \mu\text{g}/\ell$ .

33. 1,2-Dichloroethane. The ARAR standard for 1,2-dichloroethane at the CPS is  $5 \mu\text{g}/\ell$ . As indicated in Figure 17, no concentrations of 1,2-dichloroethane above the CRL were reported for any of the three system influent, carbon/alumina effluent, or system effluent samples analyzed for 1,2-dichloroethane in FY91. Thus, no concentrations of 1,2-dichloroethane above the ARAR standard were reported for any system effluent samples in FY91.

34. 1,1-Dichloroethylene. The ARAR standard for 1,1-dichloroethylene at the CPS is  $7 \mu\text{g}/\ell$ . As indicated in Figure 18, no concentrations of 1,1-dichloroethylene above the CRL were reported for any of the three system influent, carbon/alumina effluent, or system effluent samples analyzed for 1,1-dichloroethylene in FY91. Thus, no concentrations of 1,1-dichloroethylene above the ARAR standard were reported for any system effluent samples in FY91.

35. 1,2-Dichloroethylene. The ARAR standard for 1,2-dichloroethylene at the CPS is  $7 \mu\text{g}/\ell$ . As indicated in Figure 19, no concentrations of 1,2-dichloroethylene above the CRL were reported for any of the three system influent, carbon/alumina effluent, or system effluent samples analyzed for 1,2-dichloroethylene in FY91. Thus, no concentrations of 1,2-dichloroethylene above the ARAR standard were reported for any system effluent samples in FY91.

36. 1,2-Dichloropropane. The ARAR standard for 1,2-dichloropropane at the CPS is  $6 \mu\text{g}/\ell$ . 1,2-Dichloropropane was not specifically analyzed for during FY91, however it was quantified in the three GC/MS analyses conducted in FY91. As a result, no graph was prepared for 1,2-dichloropropane. The GC/MS results indicate that no concentrations above  $1.0 \mu\text{g}/\ell$  were reported in any of the samples subjected to GC/MS analysis in FY91. Thus, no concentrations of 1,2-dichloropropane above the ARAR standard were reported for any CPS effluent samples in FY91.

37. Dieldrin. The ARAR standard for dieldrin at the CPS is  $0.1 \mu\text{g}/\ell$ . The concentrations of dieldrin reported for the two influent samples collected in FY91 were  $0.29 \mu\text{g}/\ell$  and  $0.61 \mu\text{g}/\ell$  with a mean value of  $0.45 \mu\text{g}/\ell$  as indicated in Figure 20. Three of the fourteen carbon/alumina effluent samples were reported with concentrations in excess of the CRL ranging from  $0.10 \mu\text{g}/\ell$  to  $0.33 \mu\text{g}/\ell$ . Five of the sixteen system effluent samples were reported with dieldrin concentrations in excess of the ARAR standard ranging from  $0.103 \mu\text{g}/\ell$  to  $0.82 \mu\text{g}/\ell$ . Nine of the sixteen system effluent samples were reported as having concentrations below the CRL.

38. Endrin. The ARAR standard for endrin at the CPS is  $0.1 \mu\text{g}/\ell$ . Only one system influent sample was analyzed for endrin in FY91 with a reported concentration below the CRL as indicated in Figure 21. Three of the fourteen carbon/alumina effluent samples were reported with concentrations in excess of the CRL ranging from  $0.05 \mu\text{g}/\ell$  to  $0.43 \mu\text{g}/\ell$ . Four of the sixteen system effluent samples were reported with endrin concentrations in excess of the ARAR standard ranging from  $0.31 \mu\text{g}/\ell$  to  $2.7 \mu\text{g}/\ell$ . Nine of the sixteen system effluent samples were reported as having concentrations below the CRL.

39. Ethylbenzene. The ARAR standard for ethylbenzene at the CPS is  $680 \mu\text{g}/\ell$ . As indicated in Figure 22, no concentrations of ethylbenzene above the CRL were reported for any of the three system influent, carbon/alumina effluent, or system effluent samples analyzed for ethylbenzene in FY91. Thus, no concentrations of ethylbenzene above the ARAR standard were reported for any system effluent samples in FY91.

40. Fluoride. The ARAR standard for fluoride at the CPS is  $2 \text{ mg}/\ell$ . The concentrations of fluoride reported for the three system influent samples collected in FY91 ranged from  $1.24 \text{ mg}/\ell$  to  $39.0 \text{ mg}/\ell$  with a mean value of  $13.9 \text{ mg}/\ell$  as indicated in Figure 23. For the three carbon/alumina effluent samples, the reported fluoride concentrations ranged from  $1.14 \text{ mg}/\ell$  to  $30 \text{ mg}/\ell$  with a mean value of  $10.9 \text{ mg}/\ell$ . One of the three system effluent samples was reported with a fluoride concentration in excess of the ARAR standard at  $43.0 \text{ mg}/\ell$ . It should be noted that the  $43.0 \text{ mg}/\ell$  value was reported for a sample collected on August 7, 1991. As previously discussed, no wastewater was discharged from the CPS during this time as the plant was being operated in a recycle mode to provide for treatment of high fluoride concentrations. Wastewater was not discharged until August 30, 1991 when the fluoride concentration was reduced to below  $2.0 \text{ mg}/\ell$  based on onsite analysis using a specific ion electrode method. The other two samples were reported with concentrations of  $1.61 \text{ mg}/\ell$  and  $1.13 \text{ mg}/\ell$ . As a result, no wastewater with a fluoride concentration in excess of  $2.0 \text{ mg}/\ell$  was actually discharged from the CPS.

41. Hexachlorocyclopentadiene. The ARAR standard for hexachlorocyclopentadiene at the CPS is  $49 \mu\text{g}/\ell$ . As indicated in Figure 24, no concentrations of hexachlorocyclopentadiene above the CRL were reported for any of the two system influent, carbon/alumina effluent, or system effluent samples analyzed for hexachlorocyclopentadiene in FY91. Thus, no concentrations of hexachlorocyclopentadiene above the ARAR standard were reported for any system effluent samples in FY91.

42. Lead. The ARAR standard for lead at the CPS is  $50 \mu\text{g}/\ell$ . The concentrations of lead reported for the three system influent samples collected in FY91 ranged from  $5.94 \mu\text{g}/\ell$  to  $69.0 \mu\text{g}/\ell$  with a mean value of  $28.1 \mu\text{g}/\ell$  as indicated in Figure 25. Only one of the three carbon/alumina effluent samples was reported with a lead concentration in excess of the CRL at  $10.4 \mu\text{g}/\ell$ . No concentrations of lead above the ARAR standard were reported for any system effluent samples in FY91. Only one of the three samples was reported with a lead concentration in excess of the CRL at  $5.33 \mu\text{g}/\ell$ . It should be noted that the CPS has no specific process for the removal of lead.

43. Mercury. The ARAR standard for mercury at the CPS is  $2 \mu\text{g}/\ell$ . The concentrations of mercury reported for the three system influent samples collected in FY91 ranged from  $0.72 \mu\text{g}/\ell$  to  $1.73 \mu\text{g}/\ell$  with a mean value of  $1.08 \mu\text{g}/\ell$  as indicated in Figure 26. Two of the three carbon/alumina effluent samples were reported with mercury concentrations in excess of the CRL with a maximum concentration of  $0.24 \mu\text{g}/\ell$  and a mean value for FY91 of  $0.17 \mu\text{g}/\ell$ . No concentrations of mercury above the ARAR standard were reported for any system effluent samples in FY91. Two of the three samples were reported with concentrations in excess of the CRL with a maximum mercury concentration of  $0.56 \mu\text{g}/\ell$  and a mean value of  $0.30 \mu\text{g}/\ell$ . It should be noted that the CPS has no specific process for the removal of mercury.

44. Parathion. The ARAR standard for parathion at the CPS is  $0.3 \mu\text{g}/\ell$ . As indicated in Figure 27, no concentrations of parathion above the CRL were reported for any of the three system influent, carbon/alumina effluent, or system effluent samples analyzed for parathion in FY91. It is not possible to determine if any of the parathion concentrations in the system effluent samples were in excess of the ARAR standard since the CRL in FY91 was higher than the ARAR standard.

45. Tetrachloroethylene. The ARAR standard for tetrachloroethylene at the CPS is  $10 \mu\text{g}/\ell$ . The concentrations of tetrachloroethylene reported for the three system influent samples collected in FY91 ranged from  $1.16 \mu\text{g}/\ell$  to  $10.0 \mu\text{g}/\ell$  with a mean value of  $5.25 \mu\text{g}/\ell$  as indicated in Figure 28. Only one of the three carbon/alumina effluent samples was reported with a tetrachloroethylene concentration in excess of the CRL at  $2.56 \mu\text{g}/\ell$ . No concentrations of tetrachloroethylene above the ARAR standard were reported for any system effluent samples in FY91. None of the three samples were reported with concentrations in excess of the CRL.

46. Toluene. The ARAR standard for toluene at the CPS is  $2,420 \mu\text{g}/\ell$ . As indicated in Figure 29, no concentrations of toluene above the CRL were reported for any of the three system influent, carbon/alumina effluent, or system effluent samples

analyzed for toluene in FY91. Thus, no concentrations of toluene above the ARAR standard were reported for any system effluent samples in FY91.

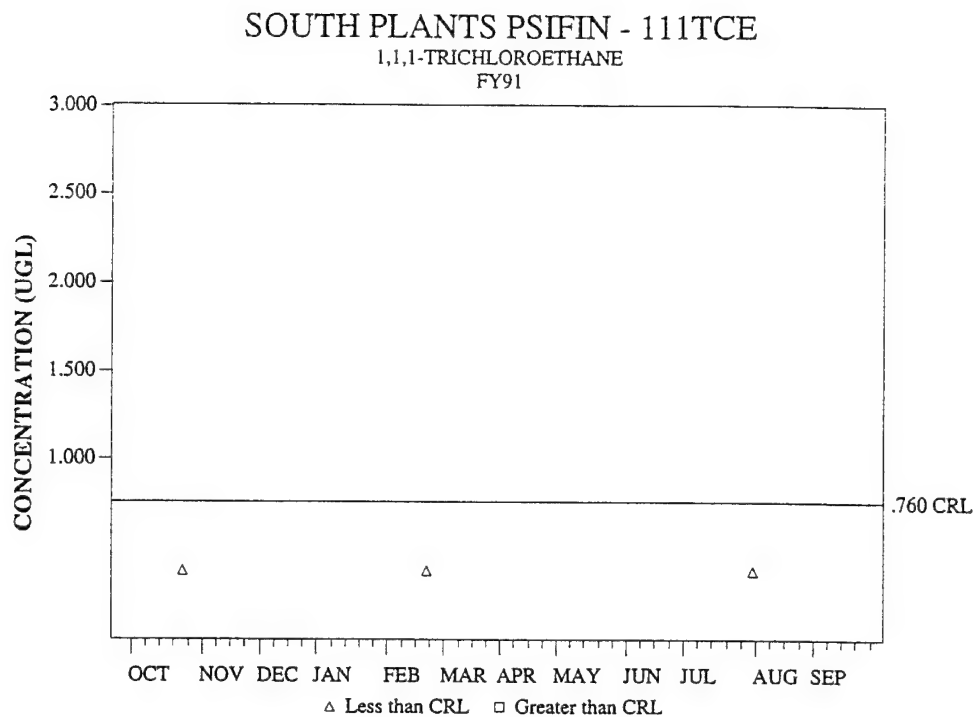

47. 1,1,1-Trichloroethane. The ARAR standard for 1,1,1-trichloroethane at the CPS is 200  $\mu\text{g}/\ell$ . As indicated in Figure 30, no concentrations of 1,1,1-trichloroethane above the CRL were reported for any of the three system influent, carbon/alumina effluent, or system effluent samples analyzed for 1,1,1-trichloroethane in FY91. Thus, no concentrations of 1,1,1-trichloroethane above the ARAR standard were reported for any system effluent samples in FY91.

48. 1,1,2-Trichloroethane. The ARAR standard for 1,1,2-trichloroethane at the CPS is 28  $\mu\text{g}/\ell$ . As indicated in Figure 31, no concentrations of 1,1,2-trichloroethane above the CRL were reported for any of the three system influent, carbon/alumina effluent, or system effluent samples analyzed for 1,1,2-trichloroethane in FY91. Thus, no concentrations of 1,1,2-trichloroethane above the ARAR standard were reported for any system effluent samples in FY91.

49. Trichloroethylene. The ARAR standard for trichloroethylene at the CPS is 5  $\mu\text{g}/\ell$ . As indicated in Figure 32, no concentrations of trichloroethylene above the CRL were reported for any of the three system influent, carbon/alumina effluent, or system effluent samples analyzed for trichloroethylene in FY91. Thus, no concentrations of trichloroethylene above the ARAR standard were reported for any system effluent samples in FY91.

50. Vinyl Chloride. The ARAR standard for vinyl chloride at the CPS is 2  $\mu\text{g}/\ell$ . As indicated in Figure 33, no concentrations of vinyl chloride above the CRL were reported for any of the three system influent, carbon/alumina effluent, or system effluent samples analyzed for vinyl chloride in FY91. Thus, no concentrations of vinyl chloride above the ARAR standard were reported for any system effluent samples in FY91.

51. Zinc. The ARAR standard for zinc at the CPS is 2,000  $\mu\text{g}/\ell$ . The concentrations of zinc reported for the three system influent samples collected in FY91 ranged from 68.3  $\mu\text{g}/\ell$  to 74.6  $\mu\text{g}/\ell$  with a mean value of 71.4  $\mu\text{g}/\ell$  as indicated in Figure 34. Two of the three carbon/alumina effluent samples were reported with a zinc concentration in excess of the CRL with a maximum concentration of 36.3  $\mu\text{g}/\ell$  and a mean value for FY91 of 26.3  $\mu\text{g}/\ell$ . No concentrations of zinc above the ARAR standard were reported for any system effluent samples in FY91. The zinc concentrations in these samples ranged from 42.7  $\mu\text{g}/\ell$  to 165  $\mu\text{g}/\ell$  with a mean value of 101.3  $\mu\text{g}/\ell$ .

### TBC Analytes

52. With respect to the TBC analytes, no concentrations of dibromochloropropane, 1,1-dichloroethane, dicyclopentadiene, methylisobutyl ketone, or xylene above their respective CRL's were reported for any of the system influent, carbon/alumina effluent, or system effluent samples for which they were analyzed in FY91. Chloroacetic acid and IMPA were not specifically analyzed for in any samples in FY91. Concentrations of atrazine (up to  $10 \mu\text{g}/\ell$ ), DIMP (up to  $110 \mu\text{g}/\ell$ ), and methylene chloride (up to  $128 \mu\text{g}/\ell$ ) were reported in system influent samples during FY91. No concentrations of atrazine above its CRL were reported for any carbon/alumina effluent or system effluent samples for which it was analyzed. Nine out of fourteen carbon/alumina effluent samples were reported with DIMP concentrations in excess of the CRL with a maximum concentration of  $10.9 \mu\text{g}/\ell$  reported. Two of three system effluent samples were reported with DIMP concentrations in excess of its CRL with a maximum concentration of  $8.05 \mu\text{g}/\ell$ . Five out of fourteen carbon/alumina effluent samples were reported with methylene chloride concentrations in excess of the CRL with a maximum concentration of  $74.4 \mu\text{g}/\ell$  reported. No concentrations of methylene chloride above its CRL were reported for any of the sixteen system effluent samples for which it was analyzed.

### Other Target Analytes

53. With respect to the other target analytes, no concentrations of bicycloheptadiene, p-chlorophenylmethyl, sulfur compounds, dithiane, dimethyldisulfide, isodrin, oxathiane, supona, or vapona above their respective CRL's were reported for any of the system influent, carbon/alumina effluent, or system effluent samples for which they were analyzed in FY91. Fluoroacetic acid and thiodiglycol were not specifically analyzed for in any samples in FY91. Concentrations of malathion above its CRL (up to  $2.97 \mu\text{g}/\ell$ ) were reported in two of the three system influent samples for which it was analyzed in FY91. No concentrations of malathion above its CRL were reported for any carbon/alumina effluent samples. One of three system effluent samples was reported with a malathion concentration in excess of its CRL at  $0.8 \mu\text{g}/\ell$ .

### GC/MS Analyses

54. GC/MS analyses were conducted on system influent, carbon/alumina effluent, and system effluent samples collected during the 1st, 2nd, and 4th quarters of FY91. Many of the analytes included in the standard analytical program were not quantified during the GC/MS analyses since the detection levels associated with the GC/MS analytical method are generally higher than the CRL's established for each analyte under the standard analytical program. A review of the data associated with

1st quarter sample analyses indicates only three analytes were reported with a concentration in excess of their detection levels. Chloroform was detected in the influent sample at a concentration of  $110 \mu\text{g}/\ell$ . The system influent sample for nitroso di-n-propylamine was reported with a concentration of  $9.76 \mu\text{g}/\ell$  which is just slightly above the detection level of  $6.80 \mu\text{g}/\ell$ . Tetrachloroethylene was reported in the influent at  $1.02 \mu\text{g}/\ell$ , slightly above the  $1.00 \mu\text{g}/\ell$  detection limit. During the 2nd quarter, the system influent sample was reported with a bis (2-ethylhexyl) phthalate concentration of  $14.7 \mu\text{g}/\ell$ . Methylene chloride was also reported above its detection level in the influent at  $93.9 \mu\text{g}/\ell$ . Chloroform was also present in the influent during second quarter analysis at  $19.0 \mu\text{g}/\ell$ . Diisopropylmethyl phosphonate was detected at  $42.5 \mu\text{g}/\ell$  in the influent, and was detected at  $24.5 \mu\text{g}/\ell$  in the activated alumina effluent. Diisopropylmethyl phosphonate was not detected in the air-stripper effluent. Tetrachloroethylene was reported at  $8.06 \mu\text{g}/\ell$ , slightly above the  $1.00 \mu\text{g}/\ell$  detection level. During the 4th quarter, the system influent sample was reported with concentrations of chloroform, sulfone, naphthalene, and tetrachloroethylene in excess of their respective detection levels. Of these four, only naphthalene is not analyzed for in the standard analytical program. No other contaminants were reported in any other samples collected during the 4th quarter with concentrations in excess of their respective detection levels. Since none of the non-standard analytes were reported in more than one quarter and since none of them were reported in any effluent samples in concentrations above their detection levels, no changes to the standard analytical program have been made.

#### Summary of CPS Effectiveness

55. Since the chemical-specific ARAR's became applicable to the CPS in FY91, there were specific contaminant concentration criteria against which to compare the effectiveness of the CPS. With respect to organic analytes, aldrin, dieldrin, and endrin concentrations were reported in excess of ARAR standards in some system effluent samples collected in FY91. Aldrin was reported in only one of sixteen effluent samples analyzed for aldrin. The concentration reported was just slightly above the ARAR standard at  $0.11 \mu\text{g}/\ell$ . All other concentrations were reported as being less than the CRL. Four of sixteen system effluent samples were reported with dieldrin and endrin concentrations in excess of their respective ARAR standards. None of the other organics were reported in system effluent samples at concentrations in excess of their respective ARAR standards.

56. With respect to inorganic analytes, arsenic and fluoride concentrations were reported in excess of ARAR standards in some system effluent samples collected

in FY91. Both arsenic and fluoride were reported in one of three effluent samples analyzed for the analytes. For both analytes, the concentrations in excess of the standards were reported for the sample collected on August 7, 1991. As previously noted, however, no wastewater was discharged from the CPS during this time since the plant was being operated in a recycle mode. Wastewater was not discharged until September 1991 when the fluoride concentration was reduced to below 2.0 mg/l based on onsite analysis. As a result, no wastewater with a fluoride concentration in excess of 2.0 mg/l was actually discharged from the CPS. Concentrations of both analytes were comparable in the system influent, carbon/alumina effluent, and system effluent samples. The CPS has no specific process for the removal of arsenic.

57. In summary, the FY91 analytical data generated for the CPS indicated a number of chemical detections above the chemical-specific ARAR standards which had been approved prior to the construction and operation of a new CERCLA Wastewater Treatment System. The CPS had not been designed to operate according to the more stringent criteria of the new proposed system. The CPS criteria was to operate until chemical breakthrough was detected, then the carbon/alumina was changed as required. Hence, there were occasions where detectable levels of aldrin, dieldrin, or endrin were noted in the effluent data. During the 4th Qtr FY91, there were a number of readings in the data showing high fluoride levels in the effluent. There were 3 periods in which the water was recirculated for retreatment until the effluent met ARAR's and was subsequently discharged. With respect to the TBC analytes, the CPS was effective in removing atrazine, DIMP, and methylene chloride. With respect to the other target analytes, the CPS was effective in removing malathion.

#### Contaminant Mass Removal

58. A calculation of the total mass of contaminants removed by the CPS during FY91 was prepared with the results shown in Table 3. The calculation was based on the difference in contaminant concentrations in the system influent and effluent. Average annual system effluent concentrations were subtracted from influent concentrations and multiplied by the flow. Values less than the CRL were set equal to one half the CRL value. The total mass of contaminants removed in FY91 was approximately 0.32 pounds. The contaminant with the largest mass removal was methylene chloride at approximately 0.12 pounds.

Table 3  
South Plants CPS Contaminant Removal, FY91

<u>Containment</u>	<u>Abbreviation</u>	<u>System Total (lbs/year)</u>
Aldrin	ALDRN	0.010
Bis (2-ethylhexyl) phthalate	B2EHP	0.007
Methylene chloride	CH <sub>2</sub> CL <sub>2</sub>	0.123
Chloroform	CHCL <sub>3</sub>	0.058
Combined Organo Sulfurs	CPMSOX	0.004
Diisopropyl methylphosphonate	DIMP	0.086
Dieldrin	DLDRN	0.010
Endrin	ENDRN	0.013
N-Nitrosodi-N-propylamine	NNDNPA	0.004
Tetrachloroethylene	TCLEE	<u>0.008</u>
Total		0.323

### PART III: CONCLUSIONS

59. Based on the evaluation of the available FY91 operations data for the South Plants CERCLA Pretreatment System, the following conclusions have been made:

- a. The CPS operated for approximately twenty-two weeks in FY91, including periods of recirculation.
- b. The CPS treated approximately 189,115 gallons during FY91.
- c. The CPS was only partially successful in meeting the chemical-specific ARAR standards established for the new CERCLA treatment sytem.
- d. The GC/MS analyses conducted on the system samples identified no significant concentrations of contaminants not currently included in the standard analytical program.
- e. The total mass of contaminants removed by the CPS during FY91 was approximately 0.32 pounds.
